

How to handle market declines

Smart investing can overcome the power of emotion by focusing on relevant research, solid data and proven strategies.

You wouldn't be human if you didn't fear loss.

Nobel Prize-winning psychologist Daniel Kahneman demonstrated this with his loss aversion theory, showing that people feel the pain of losing money more than they enjoy gains. The natural instinct is to flee the market when it starts to plummet, just as greed prompts people to jump back in when stocks are skyrocketing. Both can have negative impacts.

But smart investing can overcome the power of emotion by focusing on relevant research, solid data and proven strategies. Here are seven principles that can help fight the urge to make emotional decisions in times of market turmoil.

Market downturns happen frequently but don't last forever

Standard & Poor's 500 Composite Index (1950-2019)

Size of decline	-5% or more	-10% or more	-15% or more	-20% or more
Average frequency*	About three times per year	About once per year	About once every four years	About once every six years
Average length [†]	43 days	112 days	262 days	401 days
Last occurrence	August 2019	December 2018	December 2018	December 2018

* Assumes 50% recovery of lost value.

[†] Measures market high to market low.

Sources: Capital Group, Standard & Poor's.

Investments are not FDIC-insured, nor are they deposits of or guaranteed by a bank or any other entity, so they may lose value.

Every S&P 500 decline of 15% or more, from 1929 through 2019, has been followed by a recovery. The average return in the first year after each of these declines was 54%.

1. Market declines are part of investing

Stocks have risen steadily for most of the last decade, but history tells us that stock market declines are an inevitable part of investing. The good news is that corrections (defined as a 10% or more decline), bear markets (an extended 20% or more decline) and other challenging patches haven't lasted forever.

The Standard & Poor's 500 Composite Index has typically dipped at least 10% about once a year, and 20% or more about every six years, according to data from 1950 to 2019. While past results are not predictive of future results, each downturn has been followed by a recovery and a new market high.

2. Time in the market matters, not market timing

No one can accurately predict short-term market moves, and investors who sit on the sidelines risk losing out on periods of meaningful price appreciation that follow downturns.

Every S&P 500 decline of 15% or more, from 1929 through 2019, has been followed by a recovery. The average return in the first year after each of these declines was 54%.

Even missing out on just a few trading days can take a toll. A hypothetical investment of \$1,000 in the S&P 500 made in 2010 would have grown to more than \$2,800 by the end of 2019. But if an investor missed just the 10 best trading days during that period, he or she would have ended up with 33% less.

\$2.897 Value of a hypothetical \$1,000 investment in the S&P 500, excluding dividends, from 1/1/10 to 12/31/19 \$1,945 \$1,458 \$1,000 \$1,148 original investment \$923 Lost 33% Lost 50% Lost 60% Lost 68% in value in value in value in value Invested Missed Missed Missed Missed entire period 10 best days 20 best days 30 best days 40 best days

Missing just a few of the market's best days can hurt investment returns

Creating and adhering to a thoughtfully constructed investment plan is another way to avoid making short-sighted investment decisions – particularly when markets move lower.

3. Emotional investing can be hazardous

Kahneman won his Nobel Prize in 2002 for his work in behavioral economics, a field that investigates how individuals make financial decisions. A key finding of behavioral economists is that people often act irrationally when making such choices.

Emotional reactions to market events are perfectly normal. Investors should expect to feel nervous when markets decline, but it's the actions taken during such periods that can mean the difference between investment success and shortfall.

One way to encourage rational investment decision-making is to understand the fundamentals of behavioral economics. Recognizing behaviors like anchoring, confirmation bias and availability bias may help investors identify potential mistakes before they make them.

4. Make a plan and stick to it

Creating and adhering to a thoughtfully constructed investment plan is another way to avoid making short-sighted investment decisions – particularly when markets move lower. The plan should take into account a number of factors, including risk tolerance and short- and long-term goals.

One way to avoid futile attempts to time the market is with dollar cost averaging, where a fixed amount of money is invested at regular intervals, regardless of market ups and downs. This approach creates a strategy in which more shares are purchased at lower prices and fewer shares are purchased at higher prices.

When stock prices fall, you can get more shares for the same amount of money and lower your average cost per share

Source: Capital Group. Over the 12-month period, the total amount invested was \$6,000, and the total number of shares purchased was 439.94. The average price at which the shares traded was \$15, and the average cost of the shares was \$13.64 (\$6,000/439.94). Hypothetical results are for illustrative purposes only and in no way represent the actual results of a specific investment. Regular investing does not ensure a profit or protect against loss. Investors should consider their willingness to keep investing when share prices are declining.

Over time investors pay less, on average, per share. Regular investing does not ensure a profit or protect against loss. Investors should consider their willingness to keep investing when share prices are declining.

Retirement plans, to which investors make automatic contributions with every paycheck, are a prime example of dollar cost averaging.

5. Diversification matters

A diversified portfolio doesn't guarantee profits or provide assurances that investments won't decrease in value, but it does help lower risk. By spreading investments across a variety of asset classes, investors can buffer the effects of volatility on their portfolios. Overall returns won't reach the highest highs of any single investment – but they won't hit the lowest lows either.

For investors who want to avoid some of the stress of downturns, diversification can help lower volatility.

6. Fixed income can help bring balance

Stocks are important building blocks of a diversified portfolio, but bonds can provide an essential counterbalance. That's because bonds typically have low correlation to the stock market, meaning that they have tended to zig when the stock market zagged.

No asset class has consistently offered the best returns year in and year out

High-quality bonds have shown resilience when stock markets are unsettled

Sources: Capital Group, Morningstar, RIMES, Standard & Poor's. Dates shown for market corrections are based on price declines of 10% or more (without dividends reinvested) in the unmanaged S&P 500 with at least 50% recovery persisting for more than one business day between declines. The returns are based on total returns in USD.

S&P 500 rolling 10-year average annual total returns

Those investors who can tune out the news and focus on their long-term goals are better positioned to plot out a wise investment strategy. What's more, bonds with a low equity correlation can potentially help soften the impact of stock market losses on your overall portfolio. Funds providing this diversification can help create durable portfolios, and investors should seek bond funds with strong track records of positive returns through a variety of markets.

Though bonds may not be able to match the growth potential of stocks, they have often shown resilience in past equity declines. For example, U.S. core bonds were flat or positive in five of the last six corrections.

7. The market tends to reward long-term investors

Is it reasonable to expect 30% returns every year? Of course not. And if stocks have moved lower in recent weeks, you shouldn't expect that to be the start of a long-term trend, either. Behavioral economics tells us recent events carry an outsized influence on our perceptions and decisions.

It's always important to maintain a long-term perspective, but especially when markets are declining. Although stocks rise and fall in the short term, they've tended to reward investors over longer periods of time. Even including downturns, the S&P 500's average annual return over all 10-year periods from 1937 to 2019 was 10.47%.

It's natural for emotions to bubble up during periods of volatility. Those investors who can tune out the news and focus on their long-term goals are better positioned to plot out a wise investment strategy.
